

**Submission - Empresa de Transformación Agraria (TRAGSA)**

First of all congratulations for the excellent work. I have noticed that the presence of Pierce's disease on the island of Mallorca is not mentioned (Moralejo et al. 2019). Pierce's disease is widely distributed in Mallorcan vineyards. It is the only site in Europe where the fastiosa subspecies and the ST1 genetic profile has been detected. I think that these data for Australia where the Mediterranean climate zones are important is very relevant. On the other hand, we have recently published a global risk maps for Pierce's disease with a rather new approach and which we believe is highly relevant to the risk analysis of Pierce's disease in Australia (Giménez-Romero et al. 2023). I think that including it in the PRA can be of great help.
